Reply to Uzair's SRS review (13 October 2026)

From Fazal. Answers to Part B's questions, decisions on Part A's open points, and what changed in the SRS files as a result. Everything below is already applied to `SRS-Fazal.md`, `SRS-Uzair.md` and `PLAN.md` on branch `docs/market-ready-plan`; the shared Parts 0 and 1 are still identical in both.

Your five questions

Q1, go-live before M3: yes. Until M3 lands, the WhatsApp readiness step counts as connected when the shop has a `whatsapp_numbers` row. Written down as **IC-10**, so it is a contract, not a verbal OK. M3 replaces it in week 3.

Q2, per-merchant LLM cap: it is M5, mine. New FR-M5.7: `message_usage` gains `llm_calls`, bumped in `gemini.ts`; `settings.llmDailyCap` (default 2,000) checked before each call; past the cap the existing "AI down" handoff path runs. Not your stream.

Q3, shop address and the business profile: both. P2 adds the address field (`merchants.address`, migration 0013). I expose `syncBusinessProfile(db, merchantId)` (**IC-9**, FR-M3.7); you call it after step 1 saves, I call it on connect. It is a no-op until a number is connected. The profile picture is not pushed at launch; Meta needs the resumable-upload API for it.

Q4, commit the SRS files: done, under `docs/launch/`, with PDFs, on the branch above. It needs one PR to reach `main`; the compare link is in the owner's hands.

Q5, phone format: digits only, everywhere. Now a rule in Part 0.3 for both streams. `merchants.phone` and `whatsapp_numbers.phone_e164` are normalised on write; every comparison strips non-digits from both sides. My M2 handshake (FR-M2.8) compares the inbound `from` with `merchants.phone` that way.

Your decisions

#	Your decision	Mine
A2.1	Compare phones as digits	**Agreed**, and generalised (Q5).
A2.2	Unique index on `merchant_users(auth_user_id)`	**Agreed.** In migration 0012. Note for later: it also forbids one person managing two shops; we drop it when team features arrive.
A2.3	Live merchant completes the wizard; attestations back-filled	**Agreed.** FR-P2.10.
A2.5	State iOS 16.4+	**Agreed.** FR-P3.2.
A2.6	Expiry job reads `unpaidExpiryHours`	**Agreed.** FR-P4.3/4.4; PLAN decision 8 now says "24 by default, 6–72".
D1	Push + email only; no WhatsApp alerts to merchants	**Agreed.** FR-P3.5 dropped; IC-3 says "never WhatsApp"; PLAN B4 updated.
D2	No `order_sent` template; merchant messages the buyer themselves	**Half.** See below.
D3	Language deferred	**Agreed.** FR-P8.4 stays deferred.
D4	Expiry configurable	**Agreed.**
D5	Address field; profile push is M-stream	**Agreed.** Q3.
D6	LLM cap ownership	**M5.** Q2.
P8	New feature for the six bot/catalog gaps	**Accepted** as P8, weeks 6–7, with one change: it **owns order-status replies outright**; I removed FR-M4.8 from M4 so we do not both build it. Merge order in IC-8 is now M4 → P5 → P8.

On D2. I keep the `order_sent` template and the paid Rs 4 button, for two reasons. First, "message the buyer yourself" means from the merchant's personal number: the shop number is on the Cloud API and has no phone app, so there is nothing for them to message from. Second, `sendTemplate()` exists anyway for `payment_update`, so the button costs nothing extra to build. **But you were right that P4 must not block on it.** P4 now sends a free-form line when the window is open and otherwise only sets `orders.pending_buyer_notice='order_sent'`; the order page says "window closed"; my button consumes the flag when M4 lands. You never call `sendTemplate()`. IC-2 stays, marked non-blocking.

On "three templates". Two, not three: `payment_update` (verified or rejected, one template with a parameter) and `order_sent`. `order_confirmed` would always be sent inside the window, where a free-form message is cheaper, so it does not exist. PLAN decision 3 was corrected this morning.

Things you could not see

You reviewed against `main` at `1fa5cd7`. The branch has moved since: my own SRS went through the same kind of review this morning and changed in ways that touch you.

- **IC-7:** a platform admin may have no shop membership. `resolveCtx()` returns `{ isPlatformAdmin: true, merchantId: null }` for them, and your P1 `no_membership` redirect must check that flag first, or the console owner gets a shop created on first login.
- **Part 0.3, one route file per feature group:** your C2 rule, adopted. P1 (week 1) extracts the admin auth hook to `requireMerchant()` in `lib/auth.ts`; every new route file applies it; platform routes apply `requirePlatformAdmin()`. Please do this first in P1, since my M3 file depends on it.
- **Part 0.3, CHANGELOG under dated headings:** your C6 rule, adopted.
- **FR-M2.8 changed:** connection is proven by the merchant texting their shop number and the bot replying, not by an outbound test. Your onboarding step 7 copy should say the same ("send any message from your phone to your shop number").

Still with the owner, not us

- Gemini billing (your G1). Nothing in P8 or M5 can be tested on the free tier.
- The Meta paperwork (G2): NTN, street address, legal name. The site still shows "To be confirmed".

Monday

Agree IC-9 and IC-10 (two lines), confirm the route-file rule, then start: you P1, me M1.
